# **Dynamic Programming**

#### **Very Easy:**

#### 1. N-th Tribonacci Number

```
The Tribonacci sequence Tn is defined as follows: T0 = 0, T1 = 1, T2 = 1, and Tn+3 = Tn + Tn+1 + Tn+2 for n >= 0. Given n, return the value of Tn.
```

```
Solution: #include
<iostream> using
namespace std;
class Solution { public: int
tribonacci(int n) {
                      if (n ==
0) return 0;
                if (n == 1 || n ==
2) return 1;
     int t0 = 0, t1 = 1, t2 = 1;
int t3;
     for (int i = 3; i \le n; ++i) {
t3 = t0 + t1 + t2;
                     t0 = t1;
t1 = t2;
              t2 = t3;
return t3;
};
int main() {
Solution solution;
  cout << "Enter number: ";</pre>
cin >> n;
  cout << "Tribonacci number: " << solution.tribonacci(n) << endl;</pre>
return 0;
}
```

#### **Output:**

```
Enter number: 25
Tribonacci number: 1389537
=== Code Execution Successful ===
```

### Easy:

### 2. Climbing Stairs

You are climbing a staircase. It takes n steps to reach the top. Each time you can either climb 1 or 2 steps. In how many distinct ways can you climb to the top?

```
Solution: #include
<iostream> using
namespace std;
class Solution { public:
int climbStairs(int n) {
if (n == 1) return 1;
     int prev1 = 1, prev2 = 2;
for (int i = 3; i \le n; ++i) {
int curr = prev1 + prev2;
prev1 = prev2;
                     prev2 =
curr;
           return
prev2;
};
int main() {
Solution solution;
int n;
  cout << "Enter number of steps: ";</pre>
  cout << "Distinct ways to climb to the top: " << solution.climbStairs(n) << endl;
return 0;
```

#### **Output:**

```
Enter number of steps: 3

Distinct ways to climb to the top: 3

=== Code Execution Successful ===
```

#### **Medium:**

### 3. Longest Palindromic Substring

Given a string s, return the longest palindromic substring in s.

#### **Solution:**

```
#include <iostream>
#include <string> using
namespace std;
class Solution { public: string
longestPalindrome(string s) {
                                    int
start = 0, maxLength = 0;
                               for (int
i = 0; i < s.size(); ++i) {
       expandAroundCenter(s, i, i, start, maxLength);
expandAroundCenter(s, i, i + 1, start, maxLength);
     return s.substr(start, maxLength);
  }
           void expandAroundCenter(const string& s, int left, int right, int&
start, int& maxLength) {
     while (left \geq 0 && right \leq s.size() && s[left] == s[right]) {
int length = right - left + 1;
                                    if (length > maxLength) {
          maxLength = length;
start = left;
       --left;
       ++right;
};
int main() {
Solution solution;
string s;
  cout << "Enter a string: ";</pre>
cin >> s;
```

```
cout << "Longest palindromic substring: " << solution.longestPalindrome(s) <<
endl; return 0;
}</pre>
```

#### **Output:**

```
Enter a string: babad
Longest palindromic substring: bab

=== Code Execution Successful ===
```

#### Hard:

### 4. Maximal Rectangle

Given a rows x cols binary matrix filled with 0's and 1's, find the largest rectangle containing only 1's and return its area.

#### **Solution:**

```
#include <iostream>
#include <vector>
#include <stack>
#include <string> using
namespace std;
class Solution { public:
  int maximalRectangle(vector<vector<char>>& matrix) {
if (matrix.empty() || matrix[0].empty()) return 0;
    int rows = matrix.size();
int cols = matrix[0].size();
vector<int> heights(cols, 0);
int maxArea = 0;
     for (int i = 0; i < rows; i++) {
for (int j = 0; j < cols; j++) {
         heights[j] = matrix[i][j] == '1' ? heights[j] + 1 : 0;
       maxArea = max(maxArea, largestRectangleArea(heights));
     }
    return maxArea;
```

```
int largestRectangleArea(vector<int>& heights) {
stack<int>s;
                   int maxArea = 0;
heights.push back(0);
     for (int i = 0; i < heights.size(); i++) {
        while (!s.empty() && heights[i] < heights[s.top()]) {
int h = heights[s.top()];
                                   s.pop();
          int width = s.empty() ? i : i - s.top() - 1;
maxArea = max(maxArea, h * width);
        s.push(i);
     }
     return maxArea;
};
int main() {
  vector<vector<char>>> matrix = {
     {'1', '0', '1', '0', '0'},
     {'1', '0', '1', '1', '1'},
     {'1', '1', '1', '1', '1'},
     {'1', '0', '0', '1', '0'}
  };
  Solution solution;
  int result = solution.maximalRectangle(matrix);
cout << "Maximal rectangle area: " << result << endl;</pre>
  return 0;
}
Output:
 Maximal rectangle area: 6
```

# Very Hard:

# 5. Cherry Pickup

You are given an n x n grid representing a field of cherries, each cell is one of three possible integers.

0 means the cell is empty, so you can pass through,

1 means the cell contains a cherry that you can pick up and pass through, or -1 means the cell contains a thorn that blocks your way.

Return the maximum number of cherries you can collect by following the rules below: Starting at the position (0, 0) and reaching (n - 1, n - 1) by moving right or down through valid path cells (cells with value 0 or 1).

After reaching (n - 1, n - 1), returning to (0, 0) by moving left or up through valid path cells.

When passing through a path cell containing a cherry, you pick it up, and the cell becomes an empty cell 0.

If there is no valid path between (0, 0) and (n - 1, n - 1), then no cherries can be collected.

#### **Solution:**

```
#include <iostream>
#include <vector> #include
<algorithm> using
namespace std;
class Solution { public:
cherryPickup(vector<vector<int>>& grid) {
int n = grid.size();
    // DP table: dp[step][r1][r2] = max cherries collected by two people at step 'step'
vector<vector<vector<int>>> dp(2 * n - 1, vector<vector<int>>(n, vector<int>(n, -1)));
    // Initialize the base case
     dp[0][0][0] = grid[0][0]; // Starting position for both people
    // Fill the DP table for each step
                                           for
(int step = 1; step < 2 * n - 1; ++step) 
       for (int r1 = max(0, step - (n - 1)); r1 \le min(n - 1, step); ++r1) {
for (int r2 = max(0, step - (n - 1)); r2 \le min(n - 1, step); ++r2) {
int c1 = step - r1;
                              int c2 = step - r2;
            if (grid[r1][c1] == -1 \parallel grid[r2][c2] == -1) continue; // Skip blocked cells
            int cherries = grid[r1][c1] + (r1 != r2 ? grid[r2][c2] : 0); // Collect cherries
            // Explore all possible ways to move from the previous step
int maxPrev = -1;
            for (int prevR1 = r1 - 1; prevR1 <= r1; ++prevR1) {
for (int prevR2 = r2 - 1; prevR2 <= r2; ++prevR2) {
int prevC1 = step - prevR1;
                                              int prevC2 = step -
prevR2;
                 if (prevR1 \ge 0 \&\& prevR1 \le n \&\& prevR2 \ge 0 \&\& prevR2 \le n)
&&
                    prevC1 \ge 0 \&\& prevC1 \le n \&\& prevC2 \ge 0 \&\& prevC2 \le n
&&
                    dp[step - 1][prevR1][prevR2] != -1) {
                    maxPrev = max(maxPrev, dp[step - 1][prevR1][prevR2]);
                  }
```

```
}
             if (maxPrev != -1) {
               dp[step][r1][r2] = max(dp[step][r1][r2], maxPrev + cherries);
          }
       }
     return dp[2 * n - 2][n - 1][n - 1] == -1 ? 0 : dp[2 * n - 2][n - 1][n - 1];
};
int main() {
  vector<vector<int>>> grid = {
     \{0, 1, -1\},\
     \{1, 0, -1\},\
     \{1, 1, 1\}
  };
  Solution solution;
  cout << "Maximum cherries picked: " << solution.cherryPickup(grid) << endl;</pre>
return 0;
}
```

### **Output:**

```
Maximum cherries picked: 5

=== Code Execution Successful ===
```
